

PGD WITHDRAWN

HIV Pre-Exposure Prophylaxis (Truvada)

This Patient Group Direction has been withdrawn and must not be used.

Reason: the instrument, not the medicine

There is no safety concern with the medicine itself. A Patient Group Direction supplies a defined product to a defined group without individual prescriber assessment. This document authorises ongoing supply with 3-monthly testing, which is the ongoing management of a long-term condition and is not what a PGD is for. Withdrawn on the ruling of Chris Pilkington, Head Pharmacist, 7 September 2026.

WHAT TO DO NOW · READ THIS BEFORE ANY PATIENT LEAVES

Do not simply stop supplying. Stopping HIV pre-exposure prophylaxis abruptly leaves people exposed, and someone who believes they are protected and is not is worse off than someone who never started.

Contact every patient currently supplied under this PGD and arrange onward supply through a sexual health service or an appropriate prescriber BEFORE their current supply runs out. Tell them plainly that their protection depends on continuing to take it, and that they should not stop while arrangements are made.

If a patient has already stopped, advise them that they are not protected and to use condoms until they are re-established on PrEP.

This is reversible

If the service is rebuilt with a prescriber writing a prescription or a Patient Specific Direction, the consultation process and records are unaffected and only the legal mechanism at the point of supply changes.
